"Quality control is an essential element in the success of Technoplast and an OGP CNC 250 is providing zero-defects delivery..."

Jurgen Haans
Sales Manager

Dutch plastics company Technoplast BV with facilities in the Netherlands, Czech Republic, Ukraine and Peoples Republic of China has invested in the OGP CNC 250!

Quality control is an essential element in the success Technoplast and an OGP CNC 250 is providing zero-defects delivery with a host of added benefits.

Technoplast is a fast-growing company which combines injection moulding with manufacturing and assembly operations to provide Total Manufacturing Services for many varied components. These include automotive parts and critical medical device components as well as high tech technical parts and assemblies.

Working in materials ranging from nylons, polypropylenes and glass-filled plastics the variety of quality needs and restraints of its customers is very wide.

Besides quality control on regular production the new investment in the OGP CNC 250 brings also huge benefits in the validation and release of purchased moulds, tools and robotics.

Particularly the set-up of Initial Sampling Reports (ISR) and Statistical Process Control reports (SPC) of multi-cavity moulds was very time-consuming.

Once programming for a new product is done all remaining other cavities can be measured automatically and logged without any problems.

Although the percentage of Asian purchased moulds is increasing Technoplast still collaborates with a number of the best European mould makers.

Nevertheless, whether moulds are Asian or European oriented, comparison to the initial restraints, validation and at the end the release by Technoplast is and will be necessary.

With the purchase of the OGP CNC 250, Technoplast instantly has a facility for inspection of virtually all the measurement parameters they need, cutting the need for multiple instruments and offering better repeatability and accuracy, even in the Z axis, than was previously available.
